1.0 INTRODUCTION

- The Lochinvar LBF range is a wall mounted or floor standing (dependent upon model) direct gas-fired high efficiency water heater.

- The burner is initiated by a full electronic ignition sequence control that incorporates a spark ignition and a flame rectification device for supervision of the flame.

- This equipment is intended for use on Group H Natural Gas (2nd Family) and LPG propane (3rd Family). The information relating to propane firing is to be found in Section 12: LPG FUEL. This equipment MUST NOT use gas other than that for which it has been designed and adjusted.

- This equipment must be installed by a competent person, registered with a H.S.E. approved body. All installations must conform to the relevant Gas Safety and Building Regulations. Health & Safety requirements must also be taken into account when installing any equipment. Failure to comply with the above may lead to prosecution.

- If the equipment is to be connected to an unvented (pressurised) system, care must be taken to ensure all extra safety requirements are satisfied should a high or low-pressure condition occur in the system.

- The equipment is designed for direct connection to a flue system.

- Ancillary Options:

4.0 GENERAL REQUIREMENTS

The Lochinvar LBF range water heater has been designed to operate trouble free for many years. These instructions should be followed closely to obtain the maximum usage and efficiency of the equipment. PLEASE read the instructions fully before installing or using the appliance.

4.1 RELATED DOCUMENTS

It is law that all gas appliances are installed by competent persons, in accordance with The Gas Safety (Installation and Use) Regulations 1998. Failure to install appliances correctly could lead to prosecution. It is in your own interest, and that of safety, to ensure that this law is complied with.

The installation of the equipment MUST be in accordance with the relevant requirements of the Gas Safety Regulations, Building Regulations, I.E.E. Regulations and the bylaws of the local water undertaking. The installation should also be in accordance with any relevant requirements of the local gas distributor and local authority.

In addition the installation should follow the relevant guidance offered in the following documents. It is not practical to list all relevant information but emphasis is placed on the following documents, as failure to comply with the guidance given will almost certainly result in an unsatisfactory installation:

- **BS 5440-1: 2008**
  - Installation and maintenance of flues and ventilation for gas appliances of rated input not exceeding 70kW net (1st, 2nd and 3rd family gases)
  - *Part 1: Specification for installation and maintenance of flues*

- **BS 5440-2: 2009**
  - Installation and maintenance of flues and ventilation for gas appliances of rated input not exceeding 70kW net (2nd and 3rd family gases)
  - *Part 2: Specification for installation and maintenance of ventilation for gas appliances*

- **BS 6700: 2006**
  - Design, installation, testing and maintenance of services supplying water for domestic use within buildings and their curtilages

- **BS 7074: 1989**
  - Application, selection and installation of expansion vessels and ancillary equipment *Parts 1 and 2 for sealed systems*

- **BS 7671: 2008**
  - Requirements for electrical installations, I.E.E. wiring regulations seventeenth edition

- **CP 342: Part 2 1974**
  - Code of practice for centralised hot water supply - buildings other than dwellings

- **IGE/UP/1: Edition 2**
  - Installation pipework on industrial and commercial premises

- **IGE/UP/2: Edition 2**
  - Gas installation pipework, boosters and compressors on industrial and commercial premises

- **IGE/UP/4: Edition 2**
  - Commissioning of gas-fired plant on industrial and commercial premises

- **Gas Safety (Installation and Use) Regulations 1998 (England, Scotland & Wales)**

- **CIBSE: Guide parts A, B and C**

- **H.S.E. guidance**
  - Automatically controlled steam and hot water boilers

- **Note PM5:**
  - HSE Approved Code of Practice L8
  - Department of Health memorandum HTM 04-01
  - Manufacturer’s notes must not be taken in any way as overriding statutory obligations.
5.0 WATER QUALITY

Water supply quality may adversely affect the efficiency and performance of water heaters and hot water systems. The situation can intensify where higher temperatures or demands exist.

When installing the Lochinvar LBF in hard water areas, it is recommended that a water treatment specialist be consulted.

5.1 ELECTRICAL ANODE PROTECTION SYSTEM

The Lochinvar LBF151 - 401 can be factory fitted with a Correx electrical anode protection system. The purpose of this system is to protect the water tank from electrolytic attack by passing a small current from an electrode immersed in the water to the internal surface of the vessel.

Whilst this system protects the unit from electrolytic attack, it should be noted that this is not a scale inhibiting or reducing device.

When the protection system is working correctly, a green light should be visible on the control panel situated on the front of the appliance. If an error occurs, this lamp will flash red. Remedial action should be taken as a matter of urgency if such a situation arises.

It is a requirement of the Correx system that the unit is connected to a PERMANENT UNINTERRUPTIBLE 230V POWER SUPPLY. There must be no switches, including time controllers in the electrical system other than the main isolator. Incorrect installation of the electrical supply will invalidate the warranty of the appliance.

6.0 LOCATION

6.1 PLANT ROOM REQUIREMENTS

The Lochinvar LBF range may only be installed in a room that complies with the appropriate ventilation requirements.

The Lochinvar LBF range can be used as a type C12, C32, C52 appliance. Due to its room sealed design, ventilation allowances for combustion air are not necessary. If the appliance is to be installed in a compartment or a hot environment, ventilation for cooling purposes must be fitted. For further guidance, please refer to Section 9: AIR SUPPLY or to BS5440-2.

6.2 GENERAL REQUIREMENTS

Corrosion of the flue ways and flue system may occur if air for combustion contains certain chemical vapours. Such corrosion may result in poor combustion and create a risk of asphyxiation. Aerosol propellants, cleaning solvents, refrigerator and air conditioning refrigerants, swimming pool chemicals, calcium and sodium chloride, waxes and process chemicals are corrosive. Products of this sort should not be stored near the water heater or outside by the air intake. The fitting of this equipment in a situation where aerosols or other chemicals may be entrained into the combustion air will invalidate the warranty.

The equipment must be installed on a level, non-combustible surface that is capable of adequately supporting its weight (when filled with water) and any ancillary equipment. The operation of the equipment must not cause the temperature of any combustible material in the vicinity of the equipment and its flue to exceed 65°C. If such a situation is unavoidable, appropriate insulation should be provided.

Locate the equipment so that if the appliance or any connecting pipework should leak, water damage will not occur. When such locations cannot be avoided it is recommended that a suitable drain pan be installed under the equipment. The pan should be adequately drained but must not restrict the ventilation airflow.

6.3 CLEARANCES

The location chosen for the equipment must permit the provision of a satisfactory flue system and, where necessary, an adequate air supply. The location must also provide adequate space for servicing and air circulation around each unit. This includes any electrical trunking laid across the floor and to the appliance.

See Table 2.4 and 2.5 for clearances. See Table 8.1 for details on flue terminal locations.

7.0 GAS SUPPLY

The Lochinvar LBF range is suitable for use on second and third family gasses 2H - G20 - 20mbar and 3P - G31 - 37mbar. Details relating to Natural Gas (2H) appear below; for details relating to Propane (3P) please refer to Section 13: LPG FUEL.
7.1 SERVICE PIPES

The local gas distributor must be consulted at the installation planning stage in order to establish the availability of an adequate supply of gas. An existing service pipe must not be used without prior consultation with the local gas distributor.

7.2 METERS

A new gas meter will be connected to the service pipe by the local gas distributor contractor. An existing gas meter should be checked, preferably by the gas distributor, to ensure that it is adequate to deal with the rate of gas supply required.

7.3 GAS SUPPLY PIPES

Supply pipes must be fitted in accordance with IGE/UP/2. Pipework from the meter to the equipment must be of adequate size. The complete installation must be purged and tested as described in IGE/UP/1. Refer to Section 13: LPG FUEL for information on LPG pipework installation guidance.

7.4 BOOSTED SUPPLIES

Where it is necessary to employ a gas pressure booster, the controls must include a low-pressure cut-off switch at the booster inlet. The local gas distributor must be consulted before a gas pressure booster is fitted.

7.5 PLANT-ROOM CONTROL VALVE

A manual valve for plant-room isolation must be fitted in the gas supply line. It must be clearly identified and readily accessible for operation, preferably by an exit.

7.6 EQUIPMENT GAS SYSTEM LEAK CHECK

An approved gas-inlet appliance isolating valve and union should be installed for each unit in a convenient and safe position and be clearly marked. Ensure that the gas-inlet appliance isolating valve is in the OFF position. Although the equipment receives a gas leak check and gas train component integrity check prior to leaving the factory, transit and installation may cause disturbance to unions, fittings and components. During commissioning a further test for tightness should be carried out on the equipment gas pipework and components.

Care must be taken not to allow leak detection fluid on or near any electrical parts or connections.
8.0 FLUE HOOD ASSEMBLY LBF151 - LBF401

8.1 UNPACKING THE FLUE HOOD

The flue hood is delivered with the water heater in a separate box that contains:

A. Flue hood casing in black painted aluminium
B. Fan assembly
C. Ø 60/100 Transition piece with flue sampling point,
   Plastic bag with fixing screws

8.2 FLUE HOOD INSTALLATION

Place the fan assembly on the top of the water heater, pointing the Ø 60 flue outlet in the desired direction.
Fix the fan in position with the screws contained in the box.

Fix the bracket with the hole for cables vertically.
Feed the air pressure switch hoses through the bracket.

Connect the motor supply cable, pos. 2 and 3. Connect the earth cable, pos. 1
Connect the two tubes to the pressure points.

**IMPORTANT:**

Pink tube → pressure point 1 (the metal one)
Clear tube → pressure point 2 (the plastic one)

Place the black flue hood casing on the heater.
Centre the Flue hood casing by means of the 4 spacers on the top of the heater:

Connect the Transition piece with sampling point
Fix the black flue hood casing to the heater using the screws supplied in the box.

TABLE 8.1 FLUE TERMINAL MINIMUM DISTANCES

9.1 FLUE SYSTEM GENERAL REQUIREMENTS

Detailed recommendations for the flue system are given in BS5440-1. The following notes are intended to give general guidance only.

9.2 APPROVED FLUE SYSTEM

This appliance is approved for use with a purpose designed adaptive room sealed flue system; the appropriate kits are available from Lochinvar Limited
9.3 CONCENTRIC FLUE SYSTEM

9.3.1 HORIZONTAL CONCENTRIC FLUE FITTING DETAILS LBF81/121

1. Determine the location of the flue terminal, taking into account minimum distances as detailed in Figure 8.1, Table 8.1 and the relevant British Standards.
2. Taking care to protect the appliance from debris and dust, drill a hole in the desired location. The diameter of the hole should be no more than 10mm greater than the diameter of the terminal.
3. Determine the required length of the flue pipe (item 3 in Figure 8.2) and cut as necessary.

**NOTE:** When determining the required length, the extension pipe must protrude by a minimum of 150mm.

**NOTE:** Once cut; remove all burrs and sharp edges.
4. Insert the flue pipe into the drilled hole. The terminal section should be installed with a slight fall to outside (Max. 10mm per metre) to prevent the ingress of water.
5. Position the internal and external wall covers (item 4 in Figure 8.2) onto the flue pipe.
6. If any additional flue components are required to connect onto the horizontal terminal these should be measured, cut accordingly and fitted using the 38mm and 60mm clamps and gaskets included with the additional components.
7. If no additional components are required fit the flue pipe to the flue hood, position the 38mm clamp and gasket and the 60mm clamp and gasket on to the flue pipe.
8. Secure the flue pipe by first sliding the 38mm clamp and gasket over the exhaust connection. Now slide the 60mm gasket and clamp into position and tighten the retaining screws.
9. With all components in position, tighten any support brackets used.

TABLE 8.3 VERTICAL CONCENTRIC FLUE KIT AND COMPONENTS LBF-81/121

1. Determine the desired location for the flue terminal, taking into account minimum distances as detailed in Figure 8.1, Table 8.1 and the relevant British Standards.
2. Taking care to protect the appliance from debris and dust, drill a hole in the desired location. The diameter of the hole should be no more than 10mm greater than the diameter of the air supply pipe of the terminal.

NOTE: The hole should be drilled from the outside to ensure that no damage is done to the roofing material. Extra care should be taken to ensure that the hole is drilled vertically.
3. Install the roof flashing and secure as appropriate.
4. Carefully insert the roof terminal through the roof flashing and hole in the roof.

NOTE: When inserting the roof terminal do not support or turn the terminal using the cap.
5. Ensure the terminal is vertical using a spirit level.
6. Fit the support bracket around the terminal and secure using appropriate fixings. Do not tighten the support bracket.
7. Fit the 90° concentric bend to the flue hood by first sliding the 38mm clamp and gasket over the exhaust connection and then pushing the elbow on to the 60mm air connection.
8. If an additional length of flue pipe is required to connect to the vertical terminal this should be measured, cut accordingly and fitted using the 38mm and 60mm clamps and gaskets included with the additional length.
9. If no additional components are required measure and cut the terminal accordingly and insert into the 100/60mm duct adaptor (item 5 in Figure 8.3) followed by the 38/60mm extension piece (item 4 in Figure 8.3) and then finally fit to the 90° bend.
10. With all components in position, tighten any support brackets used.

1. Determine the location of the flue terminal, taking into account minimum distances as detailed in Figure 8.1, Table 8.1 and the relevant British Standards.
2. Taking care to protect the appliance from debris and dust, drill a hole in the desired location. The diameter of the hole should be no more than 10mm greater than the diameter of the terminal.
3. Determine the required length of the flue pipe (item 3 in Figure 8.4) and cut as necessary.

**NOTE:**
When determining the required length, the extension pipe must protrude by a minimum of 150mm.

**NOTE:**
Ensure that the terminal end (item 5 in Figure 8.4) is correctly positioned so as the row of air inlet openings are clearly visible.

**NOTE:**
Once cut; remove all burrs and sharp edges.
4. Insert the flue pipe into the drilled hole. The terminal section should be installed with a slight fall to outside (Max. 10mm per metre) to prevent the ingress of water.
5. Position the internal and external wall covers (item 4 in Figure 8.4) onto the flue pipe.
6. If any additional flue components are required to connect onto the horizontal terminal these should be measured and cut accordingly. Due to the close tolerances in the flue system, it may be necessary to use a twisting action to fit the joints together. No lubrication other than water should be used.
7. If no additional components are required fit the supplied transition piece (with sampling point) to the flue hood. The Terminal length can then be inserted.
8. With all components in position, tighten any support brackets used.

</table>

1. Determine the location of the flue terminal and air intake, taking into account minimum distances as detailed in Figure 8.1, Table 8.1 and the relevant British Standards.

**NOTE:** When installing the water heater as a Type C appliance, the terminals must not be installed on opposite sides of the building.

2. Taking care to protect the appliance from debris and dust, drill holes in the desired locations. The diameter of the hole should be no more than 10mm greater than the diameter of the terminal.

**NOTE:** When determining the required lengths, the outlet extension pipe must protrude by a minimum of 150mm and the air inlet a minimum of 10mm.

**NOTE:** Once cut; remove all burrs and sharp edges.

3. Determine the required length of the extension pipes (items 7 & 3 in Figure 8.6) and cut as necessary.

4. Insert the extension pipes into the drilled holes. The terminal sections should be installed level or with a fall to outside (Max. 10mm per metre) to prevent the ingress of water.

5. Fit the relevant air intake and flue outlet terminal end fittings, securing with the supplied screws.

6. Position the internal and external wall covers (items 8 & 9 in Figure 8.6) onto each terminal.

7. Measure, cut accordingly and fit the 38mm flue length (item 5 in Figure 8.6) to the flue hood assembly using the 38mm gasket and clamp provided.

8. Slide the 60mm/38mm concentric adaptor (item 2 in Figure 8.6) over the 38mm pipe and push fit onto the flue hood. Tighten the adaptor clamp bracket (item 4 in Figure 8.6) over the 38mm pipe.

9. Fit the 38mm 90° bend (item 6 in Figure 8.6) onto the 38mm flue length, secure the elbow by using the 38mm gaskets and clamps provided.

10. If additional lengths of flue pipe are required to connect to the terminals these should be measured, cut accordingly and fitted. If no additional components are required fit the flue lengths to the 38mm elbow and the 60mm connection on the concentric adaptor.

11. With all components in position, tighten any support brackets used.

1. Determine the location of the flue terminal and air intake, taking into account minimum distances as detailed in Figure 8.1, Table 8.1 and the relevant British Standards.
2. Taking care to protect the appliance from debris and dust, drill holes in the desired locations. The diameter of the holes should be no more than 10mm greater than the diameter of the relevant terminal.
3. Determine the required length of the extension pipe (item 3 in Figure 8.8) and cut as necessary.

**NOTE:** When determining the required length, the extension pipe must protrude by a minimum of 150mm.

**NOTE:** Once cut; remove all burrs and sharp edges.
4. Insert the extension pipe into the drilled hole. The terminal sections should be installed with a slight fall to outside (Max. 10mm per metre) to prevent the ingress of water.
5. Fill the void between the extension pipe and wall with water resistant sealant.
6. Repeat the above procedure for the air supply, noting the minimum protrusion is reduced to 10mm.
7. Fit the relevant air intake and flue outlet terminal end fittings.
8. Position the internal and external wall covers (item 6 in Figure 8.8) onto each terminal length.
9. Fit the supplied transition piece (with sampling point) (item 4 in Figure 8.8) and the air duct closure piece (item 5 in Figure 8.8) to the flue hood.
10. Remove the blanking plate on side of the flue hood and fit the air intake transition piece and gasket (items 1 & 2 in Figure 8.8), taking into account the information in Section 9.6.1: AIR RESTRICTION PLATE. Fit a 90°bend to the transition piece if the flue and air terminals are required on the same wall.
11. If an additional length of flue pipe is required to connect to the terminal lengths, these should be measured and cut accordingly. Due to the close tolerances in the flue system, it may be necessary to use a twisting action to fit the joints together. No lubrication other than water should be used.
12. If no additional components are required, measure and cut the terminal lengths accordingly and insert them into the flue hood assembly.
13. With all components in position, tighten any support brackets used.
9.4.4 VERTICAL TWIN PIPE FLUE FITTING DETAILS LBF151 – 401

**TABLE 8.9 VERTICAL TWIN PIPE FLUE AND COMPONENTS LBF151 -401**

</tr>
</tbody>
</table>

1. Determine the desired location for the flue terminal and air intake, taking into account minimum distances as detailed in Figure 8.1, Table 8.1 and the relevant British Standards.
2. Taking care to protect the appliance from debris and dust, drill the holes in the desired locations. The diameter of the holes should be no more than 10mm greater than the diameter of the lower section of the vertical terminal.

**NOTE:** The holes should be drilled from the outside to ensure that no damage is done to the roofing material. Extra care should be taken to ensure that the hole is drilled vertically.

3. Install the roof flashing and secure as appropriate.
4. Carefully insert the roof terminal through the roof flashing.

**NOTE:** When inserting the roof terminal do not support or turn the terminal using the cap.
5. Ensure the terminal is vertical using a spirit level.
6. Fit the support bracket around the terminal and secure using appropriate fixings. Do not tighten the support bracket.
7. Fit the supplied transition piece (with sampling point) (item 5 in Figure 8.9) and the air duct closure piece (item 6 in Figure 8.9) to the flue hood.
8. Remove the blanking plate on side of the flue hood and fit the air intake transition piece and gasket (items 1 & 2 in Figure 8.9), taking into account the information in Section 9.6.1: AIR RESTRICTION PLATE.
9. If additional lengths of flue pipe are required to connect to the terminal lengths, these should be measured and cut accordingly. Due to the close tolerances in the flue system, it may be necessary to use a twisting action to fit the joints together. No lubrication other than water should be used.
10. Install the remainder of the flue and air intake system working progressively away from the flue hood. With all components in position, tighten any support brackets used.
9.5 MAXIMUM FLUE LENGTH - CONCENTRIC

When using the concentric flue system the maximum flue length for all models is 3 metres for horizontal termination and 2 metres for vertical termination. For each 45° bend, 0.5 metres should be deducted from the total length. For each 90° bend 1.0 metre should be deducted from the total length.

NOTE: The maximum flue run includes the length of the terminal.

9.6 MAXIMUM FLUE LENGTH – TWIN-PIPE

When using the twin-pipe flue system, the maximum flue length is 6 metres for both the inlet and exhaust pipe. For each 45° bend, 0.5 metres should be deducted from the total length. For each 90° bend 1.0 metre should be deducted from the total length.

NOTE: This is the maximum length for each pipe and not an aggregate for the two, for example a 3 metre inlet cannot be combined with a 9 metre exhaust.

9.6.1 AIR RESTRICTION PLATE

The following restriction plate should be inserted if required:

- LBF151/171 No Restriction Plate required.
- LBF221 Ø 52mm Restriction Plate required.
- LBF301 Ø 52mm Restriction Plate required if air and exhaust ducts less than 3m (no restriction plate is needed for ducts over 3m).
- LBF401 No Restriction Plate required.

The air restriction plates are supplied with the twin-pipe flue system and should be fitted as shown in Figure 8.10.

FIGURE 8.10 POSITION OF AIR RESTRICTION PLATE
9.7 FLUE DISCHARGE

The flue system must ensure safe and efficient operation of the equipment to which it is attached, protect the combustion process from wind effects and disperse the products of combustion to open external air.

The flue must terminate in a freely exposed position and be so situated as to prevent the products of combustion entering any opening in a building.

For further information on terminal locations, please refer to Figure 8.1.

9.8 FLUE HOOD POSITION

On top of each appliance are 4 holes for fixing the flue hood onto the top of the heater, these allow four possible flue hood positions each at 90° from each other. If an intermediate position is required new holes should be drilled in the relevant locations.

9.9 FLUE TERMINAL GUARDING

If a horizontal flue terminal is to be fitted less than 2 metres from ground level or in a location where it can be touched from a window, door or balcony, a terminal guard must be fitted.

The guard should be installed centrally around the terminal ensuring a gap of at least 50mm between the guard and terminal is maintained.

10.0 AIR SUPPLY

The following information is based on single water heater installations only. If more than one water heater is being used, **BS5440-2** should be consulted to calculate the necessary requirements.

10.1 COMBUSTION VENTILATION

Ventilation for combustion is not necessary as the combustion air is ducted directly from outside.

10.2 COOLING VENTILATION

When the appliance is installed in a compartment or an enclosure, cooling ventilation should be provided as follows:

<table>
<thead>
<tr>

**TABLE 9.1 COOLING VENTILATION REQUIREMENTS**
11.0 WATER CONNECTIONS

11.1 GENERAL

Water connection locations are shown in Section 2.1: DIMENSIONAL DRAWINGS. The size of the water connections are given in Table 3.1.

The maximum length of hot water draw-off dead legs, when a secondary return is not fitted shall be in accordance with CP342.

All circulating/distribution pipework should be covered with suitable insulation.

Ideally, individual valves should be fitted to each unit to enable isolation from the system. The arrangement must be in accordance with the requirements of BS6700.

11.1.1 SYSTEM DE-STRATIFICATION

In a vessel containing water at different temperatures the hotter water will tend to accumulate at the top with progressively cooler water further down; this layering effect is called stratification. The design of storage water heaters allows heat transfer throughout the volume of water and therefore the stratification effect can lead to overheating in the hotter areas at the top of the vessel. Where cooler pockets occur in the stored volume, there is also a risk of the incubation of Legionella and other waterborne bacteria.

A de-stratification pump kit is available from Lochinvar Limited as an ancillary option. The de-stratification kit works by using a pump to circulate water from the top of the vessel to the bottom of the vessel. This action ensures that the water held in the unit is maintained at a consistent temperature throughout. By achieving a uniformed stored water temperature of at least 60°C, the risk of any bacterial contamination is virtually eliminated.

Systems that have a building loop incorporated onto the vessel may not require a de-stratification kit, as the circulation around the building from the top of the vessel back to the bottom should provide sufficient mixing.

Lochinvar has developed this kit to meet the stringent recommendations of both the HSE Approved Code of Practice L8 and Department of Health memorandum HTM 04-01 relating to the control of Legionella. For full compliance, a timer should be used to operate the pump for a period of at least 1 hour each day.

Where the pump is used to prevent overheating, it should run throughout the operational period of the water heater.

11.2 OPEN VENTED SYSTEM ARRANGEMENT

The Lochinvar LBF range can be used in an open vented arrangement provided that a vent pipe in accordance with CP 342, or BS6700 as appropriate is fitted. For typical installation schematic drawings, refer to Figure 10.1 & Figure 10.2.

11.3 UNVENTED SYSTEM ARRANGEMENT

NOTE: IT IS STRONGLY RECOMMENDED THAT UNVENTED HOT WATER SYSTEMS BE INSTALLED BY AN APPROVED INSTALLER.

If the Lochinvar LBF range is to be used in an unvented arrangement, the system should follow the guidance given in BS6700 and must comply with The Building Regulations 2000: Part G3. A kit of components that have been suitably sized for the unvented operation of the appliance is available from Lochinvar Limited. For typical installation schematic drawings, refer to Figure 10.3 & Figure 10.4.

</tbody>
</table>

**TABLE 11.1 ELECTRICAL SUPPLY REQUIREMENTS**

**WARNING: THIS APPLIANCE MUST BE EARTHED**

A suitably competent person MUST check wiring. Normal supply required is 230 VAC, single phase, 50 Hz. An isolator with a contact separation of at least 3mm in all poles should be sited close to the equipment and must only serve that equipment. The double pole switch must be readily accessible under all conditions.

12.1 ELECTRICAL CONNECTION

Access to the electrical connections is via the control panel. The appliance is supplied with a length of three-core cable for connection to the mains electrical supply. If wiring in conduit is preferred, the cable and gland made into the unit should be removed. Wiring should be completed in heat-resistant cable with a minimum cross sectional area of 1mm\(^2\).

The site wiring terminal rail is marked with Live, Neutral and Earth connections. External fuses should be rated at 6A. Correct polarity must be observed for correct operation of the ignition control system.
12.2  EXTERNAL CONTROLS

To achieve time control over the water heater, the main power supply to the appliance should be interrupted.

It is essential that the Correx non-sacrificial anode protection system has an independent power supply if time control is required.

The water heater can give a 240 VAC output to indicate flame failure and burner on conditions. The LBF151 – LBF401 can also give a high temperature limit indication.

The outputs can be found on the power supply PCB and are marked as follows:

- SV = Burner on
- TS = High temperature limit (Where applicable)
- SB = Flame failure

Relays to convert these outputs into volt-free contacts are available as ancillary options; the part number for the relay is RLY2716 and one relay will be required for each option.

12.3  ARC WELDING PRECAUTIONS

The appliance must be isolated from the mains electricity supply in the event of electric arc welding being carried out on any connecting pipework.

12.4  ANCILLARY EQUIPMENT

Any allied circulating pump should have a separate power source with suitably sized overload protection.
### COMPONENTS

### TABLE 11.2  WIRING DIAGRAM LEGEND
13.0 COMMISSIONING AND TESTING

13.1 ELECTRICAL INSTALLATION

Notes on the requirements for electrical installation are provided in Section 11: ELECTRICAL SUPPLY. A schematic drawing of the control circuit is shown in Figures 11.1 & 11.2.

13.2 GAS INSTALLATION

For design see Section 7: GAS SUPPLY. See Figures 2.4, 2.5 & 2.6 for details on the position of the gas connection.

13.3 WATER CONNECTIONS

For design see Section 10: WATER CONNECTIONS

*The system should be thoroughly flushed out with cold water without any circulating pump in position. Ensure all the valves are open.*

If a return pump is to be fitted, it should be fitted before the system is filled and air locks cleared. Check the system for leaks and repair as necessary. If the system is configured in an unvented arrangement, check the expansion vessel cushion pressure.

13.4 COMMISSIONING THE EQUIPMENT

13.4.1 GENERAL CHECKS PRIOR TO LIGHTING

A person deemed competent MUST be responsible for the commissioning of this equipment. Before attempting to commission any equipment, ensure that personnel involved are aware of what action is about to be taken and begin by making the following checks:

1. Flueway passages are clear and the termination complies with Table 8.1.
2. Ensure that the flue run is within the maximum length specified within Table 3.1.
3. Adequate ventilation exists in the plant room (if necessary).
4. The system is fully charged with water, ready to receive heat. All necessary valves are open and the building return pump (if fitted) is circulating water.
5. The gas supply pipework is clear of any loose matter, tested for soundness and purged.

13.4.2 EQUIPMENT CHECKS PRIOR TO LIGHTING

This unit has been designed for a nominal gas inlet pressure of 20 mbar when used on natural gas. Information relating to propane firing can be found in Section 13: LPG FUEL

1. Gas supply is connected but turned to the “off” position. Any unions or fittings are correctly tightened, test points are closed and the flame sense electrode lead is connected correctly. Ensure the ceramic sheath around the flame sense electrode is not cracked or broken.
2. Ensure electricity supply is connected and that the thermostat bulbs are fully located into their pocket. Reset the overheat limit switch by firmly pressing the pin.
13.4.3 CONTROL PANEL

**LEGEND**
A- On/Off switch  
B- Adjustable thermostat  
C- Thermometer  
D- Burner on light (green)  
E- Lock-out light and re-set button  
F- Sight glass

**FIGURE 12.1**  LBF81/121 CONTROL PANEL

**FIGURE 12.2**  LBF151 – 401 CONTROL PANEL

13.4.4 PROCEDURE FOR INITIAL LIGHTING

IF THE UNIT IS TO OPERATE ON LPG REFER TO SECTION 13: LPG FUEL BEFORE PROCEEDING

1. Ensure that the gas-inlet appliance isolating valve, provided by the installer, is in the “off” position.
2. Press the power rocker switch, positioned on the front of the appliance next to the control thermostat, to bring the equipment on. See *Figure 12.1* or *12.2* for location.
3. Set the control thermostat to a value above that of the stored water.
4. The combustion fan should start and purge the combustion chamber. The spark generator should create a spark and the gas solenoid should open. As the gas-inlet appliance isolating valve is closed the appliance should go to a flame failure condition within 10 seconds this will be indicated by a red lock-out light on the control panel.
5. If the above occurs correctly, open the gas-inlet appliance isolating valve and reset the unit by depressing the red lock-out light on the control panel and a new ignition cycle will begin.
6. The combustion fan will repeat the pre-purge procedure and attempt to light. Once a flame is established, the green ‘Burner On’ lamp, located on the control panel, will illuminate.
7. Allow the system to reach temperature to check operation of control thermostat.
8. Once the thermostat has been satisfied, check that the flame has been extinguished.
13.4.5 GAS PRESSURE ADJUSTMENT

1. After the burner has operated for approximately 10 minutes, switch off the equipment.
2. Open the pressure test point on the inlet side of the gas valve, attach a manometer and check the standing gas-inlet pressure. See Figure 12.3 or 12.4 for location.
3. Relight the appliance and check the operating gas-inlet pressure.

NOTE: The equipment has been designed to conform to the requirements of the Gas Appliance (Safety) Regulations (1992). For Natural Gas the gas pressure governor control system is configured for a nominal gas inlet pressure of 20 mbar, with a maximum inlet pressure of 25 mbar. Information relating to propane firing can be found in Section 13: LPG FUEL.
4. Switch off the appliance, remove manometer and close pressure test point.
5. Open the pressure test point on the outlet side of the gas valve and attach a manometer.
6. Relight the appliance and check the burner pressure according to the model.
7. If required, the burner pressure can be corrected by removing the dust cap with a large slotted screwdriver and the adjusting screw turned clockwise to increase burner pressure or counter-clockwise to decrease burner pressure. Details of the correct burner pressure can be found in Table 3.1.

NOTE: If the dust cap is removed, once reinstalled it should be marked with an anti-tamper indicator.
8. Carry out a combustion analysis. **Record all readings for future reference on a relevant commissioning sheet.**

FIGURE 12.3 GAS VALVES

![Diagram of gas valves]

LBF81/121

LBF151 - 401
13.5 TEMPERATURE ADJUSTMENT PROCEDURE

The temperature selector knob of the operator thermostat will be adjusted to its lowest setting when dispatched from the factory. The control thermostat setting should be adjusted to ensure that the water is stored at 60°C and distributed at 50°C within 1 (one) minute at all outlets. Care is needed to avoid much higher temperatures because of the risk of scalding. At 50°C the risk of scalding is small for most people, but the risk increases rapidly with higher temperatures and for longer exposure times. The risk to young children and to those with a sensory or mobility loss will be greater. Where a significant scalding risk has been identified, the use of thermostatic mixing valves on baths and showers should be considered to reduce temperature, these need to be placed as close to the point of use as possible.

14.0 LPG FUEL

NOTE! IT IS STRONGLY RECOMMENDED THAT, ON LPG INSTALLATIONS, GAS DETECTION EQUIPMENT IS FITTED. THIS EQUIPMENT SHOULD BE POSITIONED NEAR THE APPLIANCE AND AT LOW LEVEL. IT IS ALSO IMPORTANT THAT THE SPACE HOUSING THE APPLIANCE IS ADEQUATELY VENTILATED AT HIGH AND LOW LEVEL. THIS APPLIANCE MUST NOT BE LOCATED BELOW GROUND E.G. IN A CELLAR.

14.1 RELATED DOCUMENTS

In addition to those documents listed in Section 4.1: RELATED DOCUMENTS within the main body of the installer’s guide the gas installation should also comply with the guidance offered in the following documents.

BS 5482-1: 2005 Code of practice for domestic butane and propane gas burning installations.
Part 1: Installations at permanent dwellings, residential park homes and commercial premises, with installation pipework sizes not exceeding dn25 for steel and dn28 for corrugated stainless steel or copper.

14.2 GAS PRESSURE GOVERNOR

Each appliance requires an inline pressure governor to be installed in the gas supply pipework, in order to set the burner pressure.

The inline governor should be located in a convenient position near to the appliance.
14.3 CONVERSION TO LPG

This process must be carried out in the order stated. Failure to follow the following procedure may lead to non-warrantable damage to the water heater. The conversion MUST be carried out by a competent person certified for work on LPG fuel.

In the event of any seal or gasket being broken it is essential that the seal or gasket be replaced. Contact Lochinvar Limited for replacement seals and gaskets.

To convert the appliance, the correct kit should be selected from the following table:

<table>
<thead>
<tr>
<th>Part Number</th>
<th>Model</th>
</tr>
</thead>
<tbody>
<tr>
<td>AKGPLC</td>
<td>LBF81 - 121</td>
</tr>
<tr>

<td>LBF151</td>
</tr>
<tr>
<td>AKGPL17</td>
<td>LBF171</td>
</tr>
<tr>
<td>AKGPL2</td>
<td>LBF221</td>
</tr>
<tr>
<td>AKGPL34</td>
<td>LBF301 - 401</td>
</tr>
</tbody>
</table>

TABLE 13.1 GAS CONVERSION KITS

14.3.1 LBF81 – 121

1. Check that the diameter of the injector contained in the kit is correct for the appliance (see Table 3.1).
2. Close the gas-inlet appliance isolating valve and isolate the electrical supply.
3. Unscrew the injector holder (Item C in Figure 13.1) with a suitable hexagonal spanner.
4. Undo the injector (Item D in Figure 13.1) and replace it with the one contained in the kit.
5. Refit the injector holder and reconnect any pipework disturbed in the removal process.
6. Unscrew the dust cap (Item A in Figure 13.1) and turn the pressure governor screw clockwise until it stops.
7. Replace the dust cap (Item A in Figure 13.1). Once reinstalled the dust cap should be marked with an anti-tamper indicator.
8. Loosen the test point screw (Item B in Figure 13.1) and attach a manometer. Start up the water heater and adjust the inline governor to give a pressure at the burner of 28.0 mbar.
9. Position the label contained in the conversion kit on the gas valve (over the existing label), in order to identify that it has been set for LPG G31.
10. Test for gas soundness and inspect all joints with leak detection fluid.
14.3.2 LBF151 – 401

1. Check that the diameter of the injector contained in the kit is correct for the appliance (see Table 3.1).
2. Close the gas-inlet appliance isolating valve and isolate the electrical supply.
3. Remove the burner by first detaching the gas pipe and the electrode cables and then undoing the retaining nuts (Item A in Figure 13.2).
4. Withdraw the burner assembly from the appliance and detach the inlet manifold.
5. Unscrew the injectors (Item B in Figure 13.2) and replace them with the ones contained in the kit. Fully tighten the injectors to ensure gas soundness.
6. For models LBF221, 301 & 401 fit the air regulator plate (Item C in Figure 13.2) to the inlet manifold.
7. Remove the dust cap (Item D in Figure 13.2) and turn the pressure governor screw clockwise until it stops.
8. Replace the dust cap (Item D in Figure 13.2). Once reinstalled the dust cap should be marked with an anti-tamper indicator.
9. Loosen the outlet test point screw (see Figure 12.3) and attach a manometer. Start up the water heater and adjust the inline governor to give a pressure at the burner of 28.0 mbar.
10. Position the label contained in the conversion kit on the gas valve (over the existing label), in order to identify that it has been set for LPG G31.
11. Test for gas soundness and inspect all joints with leak detection fluid.

14.4 LPG COMMISSIONING AND TESTING

The commissioning procedure of the LBF range on LPG-Propane (3rd Family) 3P is similar to that on Natural Gas (2nd Family) 2H. The design and installation details described in Section 11: COMMISSIONING AND TESTING of the installer’s guide should be followed.
15.0 MAINTENANCE

15.1 GENERAL

KEEP APPLIANCE AREA CLEAR AND FREE FROM COMBUSTIBLE MATERIALS AND FLAMMABLE VAPORS AND LIQUIDS.

A competent person should check and ensure that the flue system, ventilation to the plant room, safety valve, drain, pressure gauge etc. are in a serviceable and working condition and still comply with the relevant standards and codes of practice, as detailed in Section 3.1 RELATED DOCUMENTS.

Servicing is recommended at intervals no greater than 12 months to ensure trouble free operation. Even if the maintenance schedule for the storage vessel is determined to be less than annually, it is important that all controls and safety features are checked for correct operation on an annual basis.

Measuring flue gas CO2 and flue gas temperatures will give an indication of the state of the flue and burner. Results of the flue gas analysis should be compared with previously measured values to establish possible loss of efficiency.

15.2 MAINTENANCE SCHEDULE

Waterborne impurities consist of the particles of soil and sand, which can settle out and form a layer of sediment on the bottom of the tank. The amount of calcium carbonate (scale) released from water is in direct proportion to water temperature and usage. The higher the water temperature or water usage, the more scale deposits are dropped out of the water.

Scale accumulation not only reduces the life of the equipment but also reduces efficiency of the water heater and increases fuel consumption. The usage of water softening equipment greatly reduces the hardness of the water. However, this equipment does not always remove all of the hardness (scale). For this reason it is recommended that a regular schedule of de-scaling be maintained.

The depth of the build-up should be measured after 3 months of operation to determine whether maintenance is required. The heater will have about 76mm (3 inches) of scale build-up when the level of scale has reached the bottom of the cleanout opening or about 25mm (1 inch) of scale build-up if it has reached the drain valve opening. A schedule for de-scaling should be set up, based on the amount of time it would take for a 13mm (1/2-in) build-up of scale. If insufficient scale has built up on the base of the vessel, then the vessel should be cleared and a longer period left before checking again to determine the required service interval.

15.3 DRAINING WATER HEATER SYSTEM

The water heater must be drained if it is to be shut down and exposed to freezing temperatures. Maintenance and service procedures may also require draining the water heater.

1. Turn off the water heater electrical isolator.
2. Connect a hose to the drain valve.
3. Locate hose’s discharge in an area where hot water will not cause any damage or injury.
4. Close the cold water inlet valve to water heater.
5. Open a nearby hot water outlet to vent the system.
6. Open the heater drain valve.
7. If the water heater is being drained for an extended shutdown, it is suggested the drain valve be left open during this period.
15.4 REMOVING SCALE AND SEDIMENT

1. Drain the heater. Refer to Section 14.3: DRAINING WATER HEATER SYSTEM.
2. Remove the front cover for LBF81/121 or the outer cover plate from lower side of water heater jacket for all other models.
3. Remove the cleanout cover and gasket from cleanout opening.
4. Remove scale or sediment using care not to damage the vitreous enamel lining.
5. Inspect cleanout plate gasket and replace if necessary.
6. Install gasket and cleanout plate. Draw plate up square by tightening the retaining nuts evenly.

15.5 SACRIFICIAL MAGNESIUM ANODES

If the Correx non-sacrificial anode protection system is used, there is no requirement to check the condition of the anodes.

The tank is protected against corrosion by means of sacrificial anode(s) fitted in the front of the storage vessel. The rate at which the anode(s) are eroded is dependent on the quality of the water; therefore it is essential that the anodes are inspected at least once a year.

NOTE: Where a water softener is used, the conditioned water may reduce the serviceable life of the tank. The condition of the anodes must therefore be checked more frequently.

15.5.1 ANODE REMOVAL LBF81/121

FIGURE 13.1 LBF81/121 ANODE LOCATION

1. Drain the water heater. Refer to Section 14.3: DRAINING WATER HEATER SYSTEM.
2. Remove the front cover and locate the cleanout opening.
3. Remove the cleanout cover, the anode (Item A in Figure 14.1) is located on the rear of this cover.
4. Inspect the condition of the anode.

NOTE: If the anode has reduced in size by more than 40% at any point along its length or if it is severely pitted, a new anode should be fitted. Particular attention should be paid to the ends of each anode to ensure excessive localised depletion has not occurred. Where the anode is covered with particles it should be cleaned.
5. The reassembly procedure is the reverse of removal, ensuring a water tight joint is achieved on the cleanout cover.
15.5.2 ANODE REMOVAL LBF151/171

FIGURE 14.2 LBF151/171 ANODE LOCATION

1. Drain the water heater. Refer to Section 14.3: DRAINING WATER HEATER SYSTEM.
2. Ensure the flue is adequately supported. Remove the flue hood assembly
3. The retaining plug for the upper anode should be visible from above the appliance.
4. Remove the anode (Item A in Figure 14.2) and check its condition.

NOTE: If the anode has reduced in size by more than 40% at any point along its length or if it is severely pitted, a new anode should be fitted. Particular attention should be paid to the ends of each anode to ensure excessive localised depletion has not occurred. Where the anode is covered with particles it should be cleaned.
5. Locate the cleanout opening and remove outer cover and then the internal plate
6. The lower anode (Item B in Figure 14.2) is located on the rear of the internal plate, inspect condition of the lower anode.
7. The reassembly procedure is the reverse of removal, ensuring a water tight joint is achieved on the cleanout cover.

15.5.3 ANODE REMOVAL LBF221 – 401

FIGURE 14.3 LBF221 – 401 ANODE LOCATION

1. Drain the water heater. Refer to Section 14.3: DRAINING WATER HEATER SYSTEM.
2. Locate the cleanout opening and remove outer cover and then the internal plate
3. The anode (Item A in Figure 14.3) is located on the rear of the internal plate, inspect condition of the lower anode.

NOTE: If the anode has reduced in size by more than 40% at any point along its length or if it is severely pitted, a new anode should be fitted. Particular attention should be paid to the ends of each anode to ensure excessive localised depletion has not occurred. Where the anode is covered with particles it should be cleaned.
4. The reassembly procedure is the reverse of removal, ensuring a water tight joint is achieved on the cleanout cover.
15.6 REFILLING THE WATER HEATER

1. Close the drain valve. Open a hot water fixture to allow air to escape. Open the cold water supply to water heater and allow the tank to fill.
2. Follow the lighting instructions as detailed in Section 12.4.4: PROCEDURE FOR INITIAL LIGHTING
3. Check for water leakage.
4. Install the front cover for LBF81/121 or the outer cover plate from lower side of water heater jacket for all other models.

15.7 BURNER REMOVAL AND CLEANING

If it has been determined that the flame picture is unacceptable, the burner can be removed and cleaned using the following procedures:

15.7.1 LBF81 & LBF121

1. If the appliance is firing, either turn down the thermostat or switch the power button to the off position.
2. Isolate the electrical and gas supplies to the heater.
3. Allow the appliance to cool down.
4. Remove the front cover.
5. Remove the control panel.
6. Disconnect the wiring to the ignition and flame sense electrodes, noting the correct locations for each.
7. Remove the outer base cover from the appliance.
8. Remove the inner base cover by removing the retaining nut, 1 x screw and 2 x locating studs.
9. Detach the gas pipe from the burner assembly.
10. Unclip the burner assembly from the storage vessel body and remove from the appliance.
11. With the burner assembly away from the heater, the burner can be gently cleaned with the brush attachment of a vacuum cleaner.
12. Clean the ignition and flame sense electrodes before reassembling the appliance.

The reassembly procedure is the reverse of the above taking care to ensure the burner seal is intact or replaced as necessary.

15.7.2 LBF151 – LBF401

1. If the appliance is firing, either turn down the thermostat or switch the power button to the off position.
2. Isolate the electrical and gas supplies to the appliance.
3. Allow the appliance to cool down.
4. Detach the gas pipe from the burner assembly.
5. Disconnect the wiring to the ignition and flame sense electrodes, noting the correct locations for each.
6. Remove the 5 retaining nuts on the burner door then slide out complete burner assembly.
7. With the burner assembly away from the heater, the burner can be gently cleaned with the brush attachment of a vacuum cleaner.
8. Clean the ignition and flame sense electrodes before reassembling the appliance.

The reassembly procedure is the reverse of the above taking care to ensure the burner door seal is intact or replaced as necessary.
15.8 OTHER CHECKS

15.8.1 RELIEF VALVE

At least once a year, the temperature and pressure relief valve and safety valve should be checked to ensure that they are in operating condition. To check each valve, lift the lever or turn the screw cap at the end of the valve several times. The valve should operate freely and seat properly.

If water does not flow, remove and inspect for obstructions or corrosion. Replace with a new valve of the recommended size as necessary.

15.9 FLUE SYSTEM

Examine the exhaust and ventilation system at least once a year. Points of inspection are as follows:

1. Check for obstructions and/or deterioration of flue pipe and terminal. Replace immediately where needed.
2. Check the terminal for any foreign material and remove as necessary.
3. Check all flue system connections for leakage and re-seal as required.
4. Check that ventilation grilles comply with current regulations (where applicable).

15.9.1 CORREX ELECTRICAL ANODE PROTECTION SYSTEM

When the protection system is working correctly, a green light should be visible on the Correx unit. If an error occurs, this lamp will flash red. Remedial action should be taken as a matter of urgency if such a situation arises.

The Correx system passes and monitors an electrical current flow through the water. If this current flow becomes too high or too low, a fault is indicated. Factors that may cause incorrect current flow include:

- Short-circuiting of the cables between the potentiostat and electrodes.
- Poor conductivity between the electrode cables and electrode connection tabs.
- Poor conductivity between the electrode connection tabs and electrode PCB.
- Poor conductivity between the storage vessel and earth tab.
- Poor conductivity between the earth tab and earth cable.
- Deposits forming on the electrodes.

16.0 USER INSTRUCTIONS

Once the installation and commissioning is complete, the equipment owner or their representative should be made aware of the lighting and operating instructions. A practical demonstration should be given describing each functional step. Incorrect use may result in injury and will also invalidate the warranty. The Installation, Commissioning and Maintenance Instructions should be handed over and kept in a safe place for easy reference. It is strongly recommended that the users read and understand the separate User Guide.

17.0 WARRANTY

IMPORTANT INFORMATION

These instructions must be read and understood before installing, commissioning, operating or maintaining the equipment.
1.5 MAINTENANCE

Service intervals should be determined during the first months of operation. Details of this procedure can be found in the Installation Commissioning and Maintenance Instructions for the appliance. If these instructions are not available, a copy should be obtained from Lochinvar’s website www.lochinvar.ltd.uk or by using the contact details on the back cover of this document.

Even if the maintenance schedule for the storage vessel is determined to be less than annually, it is important that all controls and safety features are checked for correct operation on an annual basis.

The sacrificial magnesium anodes must be inspected at least once a year unless the Correx non-sacrificial anode protection system is used, in which case there is no requirement to check the condition of the anodes.

A competent person should check and ensure that the flue system, ventilation to the plant room, safety valve, drain, pressure gauge etc. are in a serviceable and working condition and still comply with the relevant standards and codes of practice as detailed in the Installation, Commissioning and Maintenance Instructions.

1.6 FROST PROTECTION

The LBF water heater has no built in frost protection system. Adequate protection must be provided to prevent the water heater being exposed to freezing temperatures.

1.7 AIR SUPPLY

 When installed in a compartment, the appliance compartment must be ventilated in accordance with relevant standards.

 Blocking these air vents may lead to severe injury, serious property damage or death.

When installed in a compartment, the appliance compartment must be ventilated in accordance with relevant standards.

1.8 FLAME FAILURE LOCKOUT

The area in which the appliance is installed should not be used to store any other materials.

Blocking these air vents may lead to severe injury, serious property damage or death.

When installed in a compartment, the appliance compartment must be ventilated in accordance with relevant standards.

The LBF water heater has no built in frost protection system. Adequate protection must be provided to prevent the water heater being exposed to freezing temperatures.

1.9 FLOOD PROTECTION

A competent person should check and ensure that the house water supply is turned off in the event of a leak or burst pipe.

In the event of a leak or burst pipe, the water heater should be repaired or replaced.

The water heater model should be determined during the first months of operation.
1.0 USER GUIDE

1.1 GENERAL REQUIREMENTS

 This equipment must be installed by a competent person, registered with a HSE approved register. All installations must conform to the relevant Gas Safety and Building regulations. Health & safety requirements must also be taken into account when installing any equipment.

 A competent person must also undertake any alterations that require the gas train or flue system to be broken.

 Any interference with a sealed component is forbidden.

 Failure to comply with the above may lead to prosecution.

 Incorrect use may result in injury and will also invalidate the warranty.

 Any interference with a sealed component is forbidden.

 A competent person must also undertake any alterations that require the gas train or flue system to be broken.

1.2 PROCEDURE FOR LIGHTING

1. Ensure that the gas-inlet appliance isolating valve is in the “off” position.

2. Press the power rocker switch, positioned on the front of the appliance next to the control thermostat, to bring the equipment on.

3. Set the control thermostat to a value above that of the stored water.

4. The combustion fan should start and purge the combustion chamber. The spark generator should create a spark and the gas solenoid should open. The gas-inlet appliance isolating valve is closed.

5. If the above occurs correctly, open the gas-inlet appliance isolating valve and reset the unit by depressing the red lock-out light on the control panel.

6. If the equipment is installed as a twin, one burner may be lit at any one time. Once a flame is established, the burner burner can be lit as shown in the diagram. Each burner should be lit sequentially, starting with the first at the far end of the storage vessel, and then moving to the other.

1.3 PROCEDURE FOR SHUTTING DOWN

To take the appliance out of service, the power rocker switch should be switched to the off position. If the appliance is to be shut down for a long period of time, the gas supply should be isolated at the gas-inlet appliance isolating valve.

1.4 TEMPERATURE ADJUSTMENT PROCEDURE

The setpoint can be adjusted using the dial thermostat on the control panel and monitored using the temperature gauge.

The setpoint should be adjusted to ensure that the water is stored at 60°C and distributed at 50°C within 1 minute at all outlets. Care is needed to avoid much higher temperatures because of the risk of scalding. At 50°C, the risk of scalding is small for most people, but the risk increases rapidly with higher temperatures and for longer exposure times. The risk to young children and to those with a sensatory or mobility loss will be greater. Where a

The equipment must be installed by a competent person, registered with a HSE approved register.
